

Single Page Classroom Fixture

1. Lesson Overview

The flipped classroom model places new instruction at home through video lectures and reserves in-class time for exercises, projects, and discussions. Research indicates that students who engage actively with material through collaborative problem-solving demonstrate significantly higher retention rates compared to passive listening. The teacher's role shifts from lecturer to facilitator, providing targeted assistance while students work through higher-order thinking tasks.

2. Whiteboard Synchronisation

Real-time whiteboard synchronisation relies on an event-driven WebSocket protocol. When a teacher moves a page index, the SDK emits a scene-change event that propagates to all participants in the room within milliseconds. Participants poll the shared scene state at 1-second intervals to handle reconnection scenarios. A PDF document uploaded before session start is converted to a series of whiteboard scenes, each corresponding to one page, enabling seamless teacher-controlled navigation.

3. Additional Notes
